

Draw the circle with centre at **O** and radius

$$R = OA$$

This is known as the circumradius

Solution:

Let AD, BE, CF are altitudes of triangle from vertices **A**, **B**, **C** respectively

The point of intersection of AD and BE is **O**;

Therefore,

$$\mathbf{O} = \left(\frac{17}{6}, \frac{-5}{6} \right) \quad (1)$$

Radius of circle with centre **O**

$$R = OA = \frac{\sqrt{122}}{6} \quad (2)$$

Therefore;

The equation of circle is

$$\left(x - \frac{17}{6} \right)^2 + \left(y - \frac{-5}{6} \right)^2 = \left(\frac{\sqrt{122}}{6} \right)^2 \quad (3)$$
